Abstract of the Disclosure

A friction wheel singler for singling bank notes ~~comprises~~ includes a singler roller 1 with grooves 2, and retaining wheels 14 cooperating with the grooves 2. The retaining wheels 14 have friction areas 14a and sliding areas 14b such that both a sliding area 14b and a friction area 14a cooperate with each groove 2 of the singler roller 1. Such a friction singler is particularly suitable for longitudinal singling of narrow bank notes and prevents skewing of the sheet to be singled during the singling process.
